Design System & Implementation Notes

Apple Liquid Glass — React Native Feasibility ▾

Current state

Your app already uses expo-blur `BlurView` in `FloatingTabBar.tsx` — the glass foundation is live. iOS 26's true Liquid Glass is a SwiftUI `.glassEffect()` modifier with specular refraction and dynamic morphing, which is **not directly available in React Native**.

Approximation without native bridging (recommended path)

- BlurView intensity 40–80 + translucent fill (experimentalBlurMethod='dimezisBlurView' on Android)
- 1px inner-top highlight border: `borderTop: '1px solid rgba(255,255,255,0.22)'`
- Specular gradient overlay via expo-linear-gradient or CSS
- Soft outer shadow for depth: `shadowOpacity: 0.28, shadowRadius: 16`
- Active pill tint via LinearGradient behind active tab icon

This achieves ~85–90% visual match with Apple's system glass.

True system glass (future option)

Requires a custom native module wrapping SwiftUI's `.glassEffect()` via expo-modules-core. Android has no equivalent — fallback to the approximation above.

Performance notes

- BlurView is GPU-intensive: use glass only for **chrome** (dock, sheets, summary bars, login cards) — never for scroll content items
- On low-end Android, fall back to solid translucent surface (90% opacity background) — test with `Platform.OS === 'android' && !Platform.isPad`

Implement liquid glass dock in React Native: Replace the current FloatingTabBar glass layer with expo-blur `BlurView` intensity 65 + translucent white 0.6 overlay + 1px inner-top highlight. For the active tab pill, use expo-linear-gradient with the accent color at 14% opacity behind the icon. On Android, set `experimentalBlurMethod='dimezisBlurView'`. Test on low-end devices and provide a solid-surface fallback when blur FPS drops below 30.
